For now, I'll focus on the overview of what you can do, and then give you an overview of what is coming up in future posts. AutoCAD is one of the main tools in the architecture, engineering, and construction (AEC) field. The program is used by architects, engineers, and draftsmen to design buildings and mechanical systems. It is also used by mechanical engineers and construction managers to design various items such as cranes, earth moving equipment, and vehicles. It also comes with a powerful vector and raster graphics tool, it offers various tools for working with the model, and it has a rich variety of standard and specialized symbols, including among others simple arcs, freeform arcs, spline curves, meshes, splines, and trim. A point, line, polyline, arc, spline, circle, polygon, and polyline shape tools are provided. It also comes with a wide variety of perspective and aligned tool options, and two powerful measurement tools: a profiler (which is used to measure the length of a line segment) and a caliper (which is used to measure the length of an arc segment). The tool is also helpful for various construction processes such as finding tools, marking tools, and routing. The main window of the program gives you a 2-D view of the model. All the commands are listed at the bottom of the window. The commands are listed in the left window, and they can be executed by clicking on the commands name or by using the keyboard shortcuts. The window will automatically update after you perform a command. The different parts of a model (line, polyline, or arc) can be selected by left or right clicking on them. Left-clicking on the line parts will make the selection incrementally larger. Right-clicking on the line parts will make the selection incrementally smaller. The line parts can be edited, rotated, and moved by using the arrow keys. The line segments can be connected by
