Export your PCB board using the Autodesk File (for example Autocad R14). Put the .dxf or .dwg or .cad or .dgn file in the "src" folder. Run the tool from the "src/RunTool.bat" file. It should give a option that it will use the "key" for making the autocad board. Please remember to delete your .dxf or .dwg or .cad or .dgn file after the run. Optional: To start the finalizing of the board, you can use the "-f" option to start the "R14 Finalize" tool. Q: Call a java method with arguments that are not reflected in the class file Is it possible to call a java method with arguments that are not reflected in the class file? For example, I have some Java code like this: public class MyClass { public static void myMethod(String str) { //... } } And I have some C++ code that uses some data from the class file to call this method: MyClass::myMethod("hello world"); Is it possible for the C++ code to call this method with arguments that aren't reflected in the class file? MyClass::myMethod("world"); The reason I want to do this is that I want to make it possible for the C++ code to add parameters to the method call, but also make it impossible for anyone to add a method to the class file. A: That is only possible with byte-code manipulation tools like just-in-time compilers or JITs. A JIT like jikes (which is a real example) has no means to generate code to manipulate the class. Any Java code that has access to the bytecode will be able to change it. Analysis of promoter structure and regulation of the metC gene encoding methylcitrate synthase in Escherichia coli. The mechanism of transcriptional regulation of the metC gene encoding methylcitrate synthase in Escherichia coli was studied using a lacZ fusion system. A DNA fragment of 508 base pairs upstream of the metC gene was fused
