With the Commodore 64, and its relatives, was there anything to worry about in terms of getting your machine going again? No. If you didn't have a power supply or never have, you just powered it up and away you went. A C128 didn't have a backdoor, but the RAM was soldered on with no desoldering protection. That wasn't even hard soldering, just the kind that could be done by just about anyone. Believe it or not, the Commodore 64 was the first personal computer that arrived with any sort of "multiuser" and/or "multimechanic" capability. No other machine came even close to this - at least, until the Mac in 1984. I bought my C64 in 1983 when they were new. I paid \$100 for it - only one of two I could afford at the time. That's about \$300 in todays money. Once I had a power supply, a case, and other stuff, it was obvious to me that it was a pretty good system. I sat down and figured it out as I went along. The

C64 was my first personal computer, as well as one of the first console video games. My first game was Fire Brigade (which I wrote under the name Blue Water Software). For those of you who have no idea what I'm talking about, this video explains the story, and has some cool images from early days of my life as an Commodore 64 user: My C64's case was black plastic, not the newer color black plastic. It had blue trim - another favorite color. It was pretty much the standard C64 case. It had 4 slots for expansion cards, and the underside had a couple of pin connectors. I didn't know what they were at the time. They were easier to open than the Commodore 128 case, because there was no desoldering to worry about, just a standard "tamper proof" (with the probable exception of someone holding the steel plate in their hands while trying to open the machine up
