Nurse-Family Partnership (NFP) is a family-centered intervention designed to increase the use of primary care resources among vulnerable families. In particular, NFP addresses increased rates of breastfeeding (BF), smoking cessation, and immunization, yet participation is low, especially among vulnerable populations. The current study employed a geographic information system (GIS) to identify potential environmental features associated with participation. Surveys were administered to participants completing NFP sessions, and descriptive statistics were used to evaluate participant characteristics (n = 549). GIS was used to analyze NFP participation rates within census tracts (

Â· I want to install the active X windows on a machine without internet or isdn.Q: Implementing a Generic-Physics Engine I am working on a 2D Game Engine in which I want to implement my own Physics Engine. I was wondering if anyone could give me some good hints on what the best way to go about this. For instance, I have read about Box2D, however from what I understand that is not suitable for a 2D Game. So what are the things I have to consider when implementing a physics engine? For instance, how do I calculate things like mass and collision detection? Thank you in advance, A: For simple 2D physics you could just use a quad tree, which is what the Box2D does. This allows you to do things like calculate forces between things by finding nearby objects. The downside is that it has been known to run out of memory on large projects (like Cities Skylines for example). But, as a first pass, using a quad tree is a good starting place. As you seem to be looking for more info, I will give you some links: A page on quad tree implementation in C++. And another where the author says the Quad tree is not suitable for games (and he provides the arguments) A: You can have infinite layers of quad trees and only use the quad-tree for collision detection (as is done by Box2D for example) Obviously with a quad-tree you will need to break your game up into tiles, however you could use the tiles to make your world space bigger. Take a look at box2d on github it's a very good public library. edit: I would recommend having a look at how Dota2 works, seems like a very popular game but they dont use the quad-tree at all A: If you want to simplify your game, just use Box2D If you want to implement a serious physics engine, it is a hard task to build it, but if you are going to try, you can start with a physics engine that supports many types of movement, like Bullet. For example, you can use Bullet in a 'turn-based' game, where 3e33713323
