This Demo is free of cost and is for educational purposes only. If you have to deal with several versions of your website files, you will want to use FTP to maintain a local backup of your website's files. Having a local backup allows you to easily restore the website if it becomes necessary. However, not all web hosting plans come with FTP access, which is why you need to learn how to use FTP. FTP stands for File Transfer Protocol. In simple terms, it's an electronic protocol used for exchanging files between a client and a server. It's the same as the protocol used for sending messages over the internet. While FTP is primarily used for transferring files to and from a server, it can also be used for sending your files to other computers. In addition to this, you can also use it to synchronize files in your computer with a central location. For more information, visit our [How-To: Use FTP](#) page. Before you learn how to use FTP, make sure that you have a local backup of the files. This way, if any files become corrupted, you will not lose them permanently. However, it's also important to remember that a backup does not guarantee a full recovery. Therefore, you should always ensure that you have a backup of your files before uploading them. In the following sections, we'll discuss some of the things that you will need to know to use FTP effectively.

FTP Network Setup You should be using a server and a client computer to get started with FTP. To start out, go to your server's directory that contains your website files. Once in that directory, create a new directory using FTP (often referred to as an FTP session) and name the new directory to be the same as the name of your website. This way, you can easily restore your website's files later. To open an FTP session, you'll need to use Filezilla or any other FTP software that you've installed. Once you've connected to the FTP site, you should see a window pop up that has the same name as your website. In this window, click the name of your website to open it. Although it's unlikely, you can also accidentally transfer files in your FTP session. To avoid this from happening, make sure that the "Automatically overwrite an existing file when transferring" option is unchecked. Enter the new directory that you just created and change the name of the folder to be the same as your

Simple installation process that only requires a fair bit of extra effort on your behalf. As mentioned above, the app is Access-based which, evidently, means that you will first have to make sure that Microsoft Office Access Runtime is present on your computer's system. Once that's been taken care of, simply launch the app's wizard-based installer and follow through the whole deployment process. Of course, this is a fairly advanced app that also offers the possibility of a so-called multi-user installation which requires a little bit more effort, as described in this official installation guide. User-friendly, feature-packed, and thoroughly-documented merchandising application. One of the app's best features becomes evident right from the start, namely its very user-friendly nature. Yes, it runs from an Access environment, but all the app's sections and features are neatly displayed in well-organized section. Without going into too much detail, the main focus here is to standardize almost all aspects of your merchandising process, to improve efficiency and profits, to minimize mistakes, and to improve the overall quality of the finished product. Luckily, this is one of those apps with a very sensible development team behind it, hence, you can benefit from a very well-sorted general instructions guide. All-encompassing and garment-orientated merchandising utility. All in all, MerchanNet is actually a very useful and quite capable app, despite what you may think based on the fact that's Access-based. Not only that, but it's also well-documented and an incredibly wide array of cover-all-the-bases features. De-mystify your merchandising. Complete guide to using Microsoft Access. Introduction.
