Features AutoCAD supports two types of objects: objects and groups. Object objects are objects that are directly linked to data in the drawing. They include, but are not limited to: lines, surfaces, 3D surfaces, non-linear solids, datum planes, datum references, datum rules, datum objects, properties, annotations, dimension lines, datum text, blocks, datum blocks, dimensions, datums, etc. Group objects are objects that are part of a group. These include, but are not limited to: dimensions, datums, dimensions with text, datum text, block, dimensions with text and blocks. The drawing outline itself is also considered a group. Overview In AutoCAD, there are three views from which the work-area is visible. The top view provides an overview of the model. The front view provides information about the surface and datums of the drawing, its relationship to external reference planes, and so on. The side view shows relationships between objects in the drawing. Organizational perspectives In AutoCAD, an Organizational Perspective is a collection of objects whose purpose is to facilitate drawing and editing, and which are organized into predefined categories. The Organizational Perspectives are divided into nine categories, listed below: Anchor An Anchor is a location in space where a drawing can be pinned or "anchored." AutoCAD defines eight basic types of anchors: Horizontal When AutoCAD draws a horizontal line, it does so based on one of three methods: Grid When you use the grid to anchor a horizontal line, AutoCAD draws a line based on the data defined in the current field of ViewSettings. A complete grid contains six major reference points (including the origin) that are spaced equally apart. In some cases, the grids can be used to correct for various forms of distortion, such as parallel shift. They can also be used to draw straight lines, and serve as reference points in the drawing. Grid Spacing When you set the grid spacing to a positive integer, the grid is replaced by a regular grid. Offset When you use the offset to anchor a line, the line is drawn based on the data defined in the current field of ViewSettings. An offset refers to the number of units to move a line drawn between two points.
