A systematic review and meta-analysis. Several studies suggest that high-hardness water might be beneficial in the prevention and treatment of allergic diseases; however, the results are inconsistent. This systematic review and meta-analysis was conducted to investigate the association between allergic rhinitis (AR) and water hardness. Databases including PubMed, Web of Science, Embase, Wanfang, the China National Knowledge Infrastructure, and VIP were systematically searched up to August 30, 2017. Randomized controlled trials and observational studies (case-control studies, cross-sectional studies, cohort studies, and case series) investigating the relationship between water hardness and AR were included. The primary outcome was the risk ratio (RR) of AR for each unit increase in water hardness. Secondary outcomes included the number of patients, patient-reported outcome (PRO) score, and risk of bias. A total of 3,979 patients from 14 studies were included in this systematic review and meta-analysis. Meta-analysis demonstrated that each unit increase in water hardness was associated with a significant reduction in the risk of developing AR (RR = 0.89; 95% CI: 0.82-0.96; P = 0.006), with moderate quality of evidence. Subgroup analyses revealed that only patients with nonseasonal AR were at an increased risk of developing AR (RR = 1.11; 95% CI: 1.01-1.22; P = 0.03) with high quality of evidence. Sensitivity analysis by removing low-quality studies confirmed the consistency of the results. Our findings suggest that the water hardness of the residential area might be a risk factor for the development of AR. However, due to the study limitations, the findings of our meta-analysis should be interpreted with caution.Q: C++11 multiple equality operators in switch-case?
