Loading a file into the working environment can be done by using either the file browser or "drag and drop" method. So, you can select any position in the code or directly write its offset value in order to modify it. Plus, you can write a new file size or compare it with the one of another file, as well as copy the code in hexadecimal or binary mode. Furthermore, it is possible to select the entire code and to use a search function, combine multiple files, fill a file with random bytes, as well as switch to a different language for the interface. i.Hex is not a concern to the computer's performance, as it runs on a very low quantity of CPU and system memory; so, it doesn't interfere with the runtime of other currently active processes.
