Problem of ageing of Ag-Hg couple observed from isotopic composition of mercury in sediments in the Skagerrak. Isotopic analysis of silver and mercury in surface sediment samples from the northern Skagerrak Sea confirmed that the Ag-Hg couple in the Skagerrak is formed by dissolution of mercury-rich nano-scale particles which are transported from the sediment source to the sea. The particles are found in small amounts at the sea surface, but those are transported to a much larger distance in the water column and finally deposited on the sea floor. The existence of an old Ag-Hg couple in the Skagerrak has two important consequences. Firstly, the whole trajectory can be traced back to the source region of the mercury-rich particles (and thus to the point in time when the particles were first deposited on the sea floor). Secondly, the lifetime of the phenomenon (about 3000 years) is relatively long compared with the migration time of the water column. This can be the explanation of the difference between the speciation of the mercury in the atmosphere in the northern and southern parts of the Skagerrak, which has recently been pointed out by A. Larsson (Geochimica et Cosmochimica Acta, 69 (2005) 3720).In the 1950s, while a student at Harvard, Tracy Kidder was asked to report on the atomic tests at the Nevada Test Site. He saw the latest models of what appeared to be full-sized tractors—the M-113 and the M-114—being tested. He was told they were nuclear-powered. The material that had been tested consisted of a small number of “rat-sized pellets” of uranium. On a regular Monday, the M-113 would be used for a short test. On Thursday, a nuclear-powered M-114 would be used for a longer run. In 1958, David Lilienthal proposed that the Nuclear Regulatory Commission regulate the tests. He was denied. But four years later, more accurate fission bombs were deployed in the air. His proposal to regulate these tests came to full fruition. Q: Migrate from non-SQLite databases to SQLite databases I have a few databases which need to be migrated to use SQLite as these are on devices and can't be up-leveled. The databases are standard 'Database'.db files from Windows. How do I go about migrating these, taking advantage of SQLite features (such as joins)? A: A few years ago when this question first came up, there was no SQLite4Windows project. If you have that now, great! (There are some projects listed at but I haven't used them). Otherwise, you can use SQLite4J (as a guide, or if you have a large number of tables that you want to migrate, you could use the corresponding SQLite3 or HSQLDB projects (and use SQLite4J to help along). Of course, using SQLite for the migration is going to be the most portable and simple. But if you have to do it, you might as well use SQLite4J to do it. A: SQLite4Windows is not available anymore. Use SQLite4J instead. Q: Dealing with success and failure in KnockoutJS I have the following code: \$.ajax({ type: "POST", url: 'admin/devices/reset/', data: ko.toJSON(this), contentType: "application/json", success: function () { // Success stuff }, error: function (e) { // Fail stuff } }); How would I go about getting the success and failure stuff in my view model? A: There are several ways to achieve what you want, all pretty much the same: 1 - If you are indeed using the already mentioned KnockoutJS with its MVVM, just use the data-bind-error and data-bind-success attributes. 2 - Accessing
