Electron probe microscopic topography of the superior colliculus in the cat. We have examined the distribution of synaptophysin, choline acetyltransferase and c-fos in the superior colliculus of the cat (subsuperior colliculus and central gray) by use of the immunofluorescence technique and the autoradiographic technique. In the central gray there was almost no background staining after single-labeling with synaptophysin; however, the neurons were clearly stained by double-labeling with synaptophysin and c-fos. In addition, most neurons in the subsuperior colliculus were stained by single- and double-labeling with synaptophysin and choline acetyltransferase. These results indicate that in the central gray there are direct synaptic inputs from the reticular formation, nucleus of the brachium of the inferior colliculus and visual cortex, whereas in the subsuperior colliculus there are moderate inputs from the colliculus, reticular formation, nucleus of the brachium of the inferior colliculus, and visual cortex.

Q: AJAX based content on UIs I am wondering if you can do some basic ajax based content on the UI of a website. A: You can but it's not the way you think. You can call the web api on the back end and populate elements like text boxes based on what you get back from the server. You could also have some javascript code to do the same thing and it's still an ajax call to the server.

Temperature effect on formation of lacunocanalicular complexes and normal keratinocytes. The aim of this study was to observe and evaluate the involvement of the lacunocanalicular complex (LC-DC) in the temperature effect on keratinocyte viability. Keratinocytes were cultured at 37 degrees C, 40 degrees C, 42 degrees C, and 43 degrees C for 24, 48, and 72 hours. Quantitative evaluations of LC-DC complex by electron microscopy indicated a reduction in the number of LC-DCs in keratinocytes exposed to 43 degrees C for 72 hours compared with controls. All temperatures used for 24 hours did not cause significant differences in the number of LC-DCs in the four different experimental times. However, after 48 and 72 hours, significant differences were noted when keratinocytes exposed to 43 degrees C were

How to generate the PWM signal by using open source code? for example, I used the Arduino as a reference, I can use it to generate the PWM signal by using pinMode, but is there a possibility that the frequency or duty cycle of that PWM can be adjusted? Or is there any others methods? A: There are several possible ways to generate PWM on the Arduino. The Arduino uses the timer-clock to create the PWM outputs. There is no way to change the frequency. There is a library function called millis() that can be used to generate PWM. For real PWM outputs, you have two ways to create PWM: a) Constant PWM b) Frequency-modulated PWM. Both are implemented in the library pwm.h. Constant PWM For constant PWM, you can use the function pwmWrite() to set the duty cycle. The value to set is in the range 0 to 255. The second argument of pwmWrite() is set to 0 to use the "clock" pin and any other value to use the "pin" pin. This function expects the value in the range 0 -
