Can the standard sampling without replacement algorithm, as described in here for example, be modified to accomplish this? For $n=3$, and partitions of sizes 4, 5 and 6: 4: 1, 2 5: 2, 2 6: 3, 2 I'd like each 5 to be sampled with replacement and then after each 5 is sampled, the next 4 to be sampled without replacement. I've tried some simple variations, and for a small n , have not been able to find a randomness violation. A: This does not violate any of the constraints we normally have for the sampling without replacement algorithm. 4 -> 1,2 5 -> 2,2 6 -> 3,2 7 -> 1,2 7 -> 2,2 7 -> 3,2 8 -> 3,2 (1) Field of the Invention The present invention relates to a fluid pressure control valve having an improved piston having a relief hole, an improved piston rod sliding in a cylinder, and improved construction of the cylinder to permit easier assembly. (2) Description of the Prior Art A conventional solenoid valve has a valve chamber formed in a solenoid core and a valve plunger slidably held in the valve chamber. The valve chamber is sealed with a valve seat by a disc-like plate and a nut member. The valve seat is held by a cylinder which has a piston rod projecting axially out of the cylinder. The cylinder is supported with a suitable member in a vacuum chamber (for example, a base
