. Wire connection table. Step 4: Special Function. Step 8: Application Note. Except for the A3 LED Indicator Panel of A1H. Step 3: Programming Interface Circuits. Omron. Step 2: Electrical Connection Table.

Q: Why do I get an error in debugging? I am using Embarcadero C++ Builder with Embarcadero XE7. I have a code below:

```
void __fastcall TForm1::CreateForm() { int error; int address=5 if (error == -1) { if (!CMyClass->AddAddress("") ) { ShowMessage("Error adding an address"); } else { ShowMessage("Success"); } } //... }
```

If I step into the first if condition, I get the error Debug Error: Invalid Symbol and no matter what I do I can't continue, and the code never executes, I get an unhandled exception, and the rest of the code is never executed. If I remove the "if (error == -1)" from the IF statement, I run the code without errors, without messages, no problem. I am using this project as a sample in another project (the project is running and it works fine) and I have the same problem. I never get "Invalid Symbol". What is happening? A: Your problem is about operator precedence and compiler support. What is happening in your sample code is this: `if (!CMyClass->AddAddress(""))` In this simple example, you don't really need the brackets, but they are used to ensure the right order of your evaluations. Try this and you'll see what I mean: `if(!CMyClass->AddAddress(""))` Or, by the way, with brackets as in your original code, it will evaluate the parentheses, then the remaining three operations, and then the return. But in
