A: No matter what Operating System the image is on (whether it be Windows, Linux, or MAC OS) you can use the usb software disk recovery tools and then use the image you have stored in that as a restore from your computer. My favorite usb software disk recovery software is macdisk from the linksys support site. This software will give you an option to save the image in a folder you specify. Once saved you can unplug the usb drive and plug it into your computer. Next open disk utility and go to File > Repair Disk Permissions. Select your usb drive and click repair permissions and then restart the computer and it will automatically do the resizing of the disk and start the image on your USB. I hope this will be helpful. A: Most Windows Image Recovery Software (find the reviews by the other members) will only allow you to recover individual files. There are a few ways to recover just one file... Alternatives: If you image is stored on a large external disk, a copy of it could be stored on another system. Then you could use that drive to search it, or if the drives are identical then you could plug them both into your system, run a disk check and boot off whichever one has the image you want. Alchemy Drive Recovery 2.0: This is the free version of Alchemy Drive Recovery, probably the best recovery program you can get for this purpose. It shows all drives, then you select the one you want and it will mount it so you can search it, you can preview what you will see, and it will even allow you to compress the image in case you need it back that way. Only show bad sectors: Another possibility is to have a backup of just the bad sector. There are 4 tools you can use to perform that task. (First are free, then get paid for as you use them.) c6a93da74d
